

Lecture 8a: Programming the LC- 3 in Assembly Language

**CSCI11: Computer Architecture
and Organization**

Readings

- *Chapter 8* [Patt and Patel: Introduction to Computing Systems...](#)
- *Guide to Using LC-3 Tools - Instructor Repo*
- *Appendix A* [Patt and Patel: Introduction to Computing Systems...](#) - *Instructor Repo*

Syllabus Updates

Date	Week	Content
3/9	6	Cookbook and Programming
3/16	7	The Stack and Programming
3/23	-	Spring Break
3/30	8	RPN and SMC
4/5	9	TRAPS and Complete SMC
4/12	10	Test 2

Monday Class - Check in Notes

1. Make sure you *Commit/Sync* often, it saves your work and updates your homework in GitHub
2. You may edit code IN LC3Tools, however, use VS Code to save your code!

AI Issues

1. LC-3 Assembly language is a bit esoteric, which means an LLM won't have a complete grasp of it
2. Microsoft's CoPilot is too aggressive, which means it regularly recommends stuff which flat out **does not work**

So what to do?

Continue to develop critical thinking skills which help you to understand where AI might be successful (or accurate) and where it will have issues, this is where you will make money.

Postfix Notation (*Reverse Polish Notation*)

Infix: $((5 + 4) * 9) / (6 - 3) =$

Postfix: $5\ 4\ +\ 9\ *\ 6\ 3\ -\ /\$

Postfix: 5 4 + 9 * 6 3 - /

1. Put a number on the stack - 5
2. Put a number on the stack - 4
3. Put a operand (+, -, *, /) on the stack - +
4. Put a number on the stack - 9
5. Put a operand (+, -, *, /) on the stack - *
6. Put a number on the stack - 6
7. Put a number on the stack - 3
8. Put a operand (+, -, *, /) on the stack - -
9. Put a operand (+, -, *, /) on the stack - /

RPN	5	4	+	9	*	6	3	-	/
							3		
		4		9		6	6	3	
Stack	5	5	9	9	81	81	81	81	27

RPN Stack

1. Operator consumes top 2 numbers on the stack
2. Result will be placed on the stack
3. There is no limit (*other than memory constraints*) to numbers on the stack
4. There must always be one less operator than numbers
5. It is helpful to have a *"print"* command such as *"."*
6. Stack doesn't delete previous entries
7. Top of the stack is at the **bottom** of memory

RPN One More Example

Walkthrough of 123++ in RPN LC3

Begin to Develop Algorithm for SMC

Week 8 Assignment

Usage:

- Enter a number 0-9, or an operator +, -, *, or /
- Calculator will use Reverse Polish Notation to calculate
- If there is only one number on stack, operation will fail
- and program will terminate
- "." will copy the top of the RPN stack into RESULT and terminate
- If stack is empty, operation will fail and program will terminate

Programming Tips

1. Setup an initialization loop, when you have a number of constants to be converted.
(*sign change*)
2. Use R4 for your *RPN* stack. Use R4 as it doesn't get over-written in system calls, making it easier to debug.
3. Keep track of register values
4. Use subroutines via jump vectors

Initialization Loop

Setup variables

```
; data section for constants
result      .fill      x0000
MULT        .fill      x2a      ; "*" multiply
PLUS        .fill      x2b      ; "+" add
...
ASCII        .fill      x30      ; ASCII to decimal conversion
count       .fill      #10      ; number of constants, MULT - ASCII
```

Initialization Loop

Change sign and store back in variable

```
                ; Setup test values for 0, 9, +, -, *, /, . and RPN stack
                LD R2, count
NEXT            LDR R0, R1, #0
                NOT R0, R0
                ADD R0, R0, #1        ; change sign of value in R0
                STR R0, R1, #0        ; save back to the original location
                ...
                BRnp NEXT
```

Learn the stack

Three Stack Examples:

- `stack_debug_v2` - illustrates how to use debug code, similar to previous example, however, error checking moved to stack code. This simplifies the application code to just JSR PUSH or JSR POP.
- `stack_prod.asm` - illustrates how to use stack code which directly manipulates the stack, much more simple code. It will be very difficult to debug!
- `stack_example.asm` - uses comments and the `stack_debug_v2` code to provide both a debug and production version. Using the stack in this method, can ensure you are able to debug, then simplify.

stack_example application code

START

```
JSR STK_INIT      ; DEBUG: Initialize stack, REQUIRED
; LD R6, USER_STACK ; PROD: Initialize stack, REQUIRED

; Set up values to be swapped and push onto stack
LD R0,A           ; Load a value to be pushed onto stack
JSR PUSH          ; DEBUG: Push a value onto the stack
; ADD R6, R6, #-1 ; PROD: Push: Decrement
; STR R0, R6, #0  ; PROD: and Store

LD R0,B           ; Load second value to be pushed onto stack
JSR PUSH          ; DEBUG: Push a value onto the stack
; ADD R6, R6, #-1 ; PROD: Push: Decrement
; STR R0, R6, #0  ; PROD: and Store
```

PUSH Reminder

Decrement and Store (*using R4 for RPN stack*)

```
; PUSH a value, R0 into TOS  
    ADD R4, R4, #-1      ; PUSH: Decrement  
    STR R0, R4, #0       ; and store
```

POP Reminder

Load and Increment (*using R4 for RPN stack*)

```
; POP two values, TOS in R2, next in R1
    LDR R2, R4, #0    ; Pop: Load
    ADD R4, R4, #1    ; and Increment
    LDR R1, R4, #0    ; Pop: Load
    ADD R4, R4, #1    ; and Increment
```

Be disciplined with registers

```
; Registers:  
; R0 – primary register for operations  
; R1 – temp register  
; R2 – temp register  
; R3 – operator vector for JSRR  
; R4 – RPN stack pointer ; use R4, so it doesn't get overwritten
```

JSR vs. JSRR

What is the difference between JSR and JSRR and why is this important?

```
JSR QUEUE    ; Put the address of the instruction following JSR into R7
              ; Jump to QUEUE (PCoffset11).
JSRR R3      ; Put the address following JSRR into R7
              ; Jump to the address contained in R3.
```

Use subroutines via jump vectors

Simple algorithm

1. Input a character
2. If character is "+", subroutine PLUS
3. If character is "-", subroutine MINUS
4. If character is "x", subroutine MULT
5. If character is "/", subroutine DIVD
6. else, subroutine ERROR

Coding with JSR

```
; if operator identified, get subroutine vector
chk_ad      LD R2, plus
             ADD R2, R0, R2
             BRnp chk_mi
             LEA R3, op_ad      ; get ADD subroutine vector

...
; load registers and goto subroutine via vector
             LDR R1, R4, #0    ; Pop: Load
             ADD R4, R4, #1    ; and Increment
             JSRR R3           ; call ADD subroutine with
                                ; arguments in registers
             BR loop           ; on return, get a new char
```

Excellent Detailed Description of RPN

- [Reverse Polish Notation](#)
